INSTALLATION INSTRUCTIONS
FOR UPFLOW, UPFLOW/HORIZONTAL,
AND DOWNFLOW INDUCED DRAFT GAS FURNACES
(-)GPH, (-)GPJ, (-)GLH & (-)GLJ SERIES

⚠️ WARNING

RECOGNIZE THIS SYMBOL AS AN INDICATION OF IMPORTANT SAFETY INFORMATION!

⚠️ WARNING

IF THE INFORMATION IN THESE INSTRUCTIONS IS NOT FOLLOWED EXACTLY, A FIRE OR EXPLOSION MAY RESULT, CAUSING PROPERTY DAMAGE, PERSONAL INJURY OR DEATH.

⚠️ WARNING

THESE INSTRUCTIONS ARE INTENDED AS AN AID TO QUALIFIED SERVICE PERSONNEL FOR PROPER INSTALLATION, ADJUSTMENT AND OPERATION OF THIS UNIT. READ THESE INSTRUCTIONS THOROUGHLY BEFORE ATTEMPTING INSTALLATION OR OPERATION. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN IMPROPER INSTALLATION, ADJUSTMENT, SERVICE OR MAINTENANCE, POSSIBLY RESULTING IN FIRE, ELECTRICAL SHOCK, CARBON MONOXIDE POISONING, EXPLOSION, PROPERTY DAMAGE, PERSONAL INJURY OR DEATH.

⚠️ WARNING

PROPOSITION 65: THIS FURNACE CONTAINS FIBERGLASS INSULATION. RESPIRABLE PARTICLES OF FIBERGLASS ARE KNOWN TO THE STATE OF CALIFORNIA AND TO THE COMMONWEALTH OF MASSACHUSETTS TO CAUSE CANCER. EXHAUST GAS FROM THIS FURNACE CONTAINS CHEMICALS, INCLUDING CARBON MONOXIDE, KNOWN TO THE STATE OF CALIFORNIA AND TO THE COMMONWEALTH OF MASSACHUSETTS TO CAUSE BIRTH DEFECTS OR OTHER REPRODUCTIVE HARM.

⚠️ WARNING

— Do not store or use gasoline or other flammable vapors and liquids, or other combustible materials in the vicinity of this or any other appliance.

— WHAT TO DO IF YOU SMELL GAS
  • Do not try to light any appliance.
  • Do not touch any electrical switch; do not use any phone in your building.
  • Immediately call your gas supplier from a neighbor’s phone. Follow the gas supplier’s instructions.
  • If you cannot reach your gas supplier, call the fire department.
  • Do not return to your home until authorized by the gas supplier or fire department.

— DO NOT RELY ON SMELL ALONE TO DETECT LEAKS. DUE TO VARIOUS FACTORS, YOU MAY NOT BE ABLE TO SMELL FUEL GASES.
  • U.L. recognized fuel gas and CO detectors are recommended in all applications, and their installation should be in accordance with the manufacturer’s recommendations and/or local laws, rules, regulations, or customs
  • Improper installation, adjustment, alteration, service or maintenance can cause injury, property damage or death. Refer to this manual. Installation and service must be performed by a qualified installer, service agency or the gas supplier. In the commonwealth of Massachusetts, installation must be performed by a licensed plumber or gas fitter for appropriate fuel

DO NOT DESTROY THIS MANUAL. PLEASE READ CAREFULLY AND KEEP IN A SAFE PLACE FOR FUTURE REFERENCE BY A SERVICEMAN.
Before beginning any troubleshooting procedure, complete the following installation checklist. A furnace malfunction is sometimes caused by an improper installation. By completing this checklist, the problem may be found and corrected. Make copies of the checklist and complete one for every Low Profile Furnace service call for your records.

**INSTALLATION CHECKLIST**
(Refer to this manual for specifics.)

**GAS SUPPLY**
- Adequate pipe size
- No gas leaks
- Proper supply and manifold gas pressure (check with an accurate U-tube manometer with the furnace and all other gas appliances operating.)

**ELECTRICAL**
- Correct thermostat and subbase
- Thermostat model
- Subbase model
- Correct thermostat mode and setting
- Correct line supply voltage
- Correct power supply polarity is required with electronic ignition
- Correct furnace ground to electrical panel
- DC microamp (µA) flame signal (hot surface ignition units)
- Correct control voltage
- Measure and set heat anticipator amperage
- Air conditioning low voltage wires connected to terminals “Y” “C” - **not with wire nuts**

**VENTING**
- Correct vent pipe diameter and length (according to CSA tables)
- Vent connection size
- Correct venting material (according to CSA tables)
- Correct lining for masonry chimneys
- Adequate clearance from combustibles
- Proper negative pressure reading in the vent
- Vent pipe secured to induced draft blower housing

**COMBUSTION AIR**
- Proper source of combustion air
- Correct combustion air opening size

**FURNACE INSTALLATION**
- Adequate clearance from combustibles
- Adequate clearance for service
- Proper air temperature rise (See furnace rating plate)
- External static pressure ________ inches w.c.
- Correct filter(s)
- Correct cooling coil or accessories (if equipped)
- Adequate supply and return air ducting ________ Return Air Duct Size ________ Supply Air Duct Size
- Air ducts sealed to prevent leakage

**IMPORTANT:** TO INSURE PROPER INSTALLATION AND OPERATION OF THIS PRODUCT, COMPLETELY READ ALL INSTRUCTIONS PRIOR TO ATTEMPTING TO ASSEMBLE, INSTALL, OPERATE, MAINTAIN OR REPAIR THIS PRODUCT. UPON UNPACKING OF THE FURNACE, INSPECT ALL PARTS FOR DAMAGE PRIOR TO INSTALLATION AND START-UP.
**SAFETY INFORMATION**

⚠️ **WARNING**
USE ONLY WITH TYPE OF GAS APPROVED FOR THIS FURNACE. REFER TO THE FURNACE RATING PLATE.

⚠️ **WARNING**
INSTALL THIS FURNACE ONLY IN A LOCATION AND POSITION AS SPECIFIED IN THE LOCATION REQUIREMENTS AND CONSIDERATIONS SECTION OF THESE INSTRUCTIONS. PROVIDE ADEQUATE COMBUSTION AND VENTILATION AIR TO THE FURNACE SPACE AS SPECIFIED IN THE VENTING SECTION OF THESE INSTRUCTIONS.

⚠️ **WARNING**
PROVIDE ADEQUATE COMBUSTION AND VENTILATION AIR TO THE FURNACE SPACE AS SPECIFIED IN THE COMBUSTION AND VENTILATION AIR SECTION OF THESE INSTRUCTIONS.

⚠️ **WARNING**
COMBUSTION PRODUCTS MUST BE DISCHARGED OUTDOORS. CONNECT THIS FURNACE TO AN APPROVED VENT SYSTEM ONLY, AS SPECIFIED IN VENT PIPE INSTALLATION SECTION OF THESE INSTRUCTIONS.

⚠️ **WARNING**
NEVER TEST FOR GAS LEAKS WITH AN OPEN FLAME. USE A COMMERCIALLY AVAILABLE SOAP SOLUTION MADE SPECIFICALLY FOR THE DETECTION OF LEAKS TO CHECK ALL CONNECTIONS, AS SPECIFIED IN GAS SUPPLY AND PIPING SECTION OF THESE INSTRUCTIONS.

⚠️ **WARNING**
ALWAYS INSTALL FURNACE TO OPERATE WITHIN THE FURNACE'S INTENDED TEMPERATURE-RISE RANGE WITH A DUCT SYSTEM WHICH HAS AN EXTERNAL STATIC PRESSURE WITHIN THE ALLOWABLE RANGE, AS SPECIFIED IN DUCTING SECTION OF THESE INSTRUCTIONS. SEE ALSO FURNACE RATING PLATE.

⚠️ **WARNING**
WHEN A FURNACE IS INSTALLED SO THAT SUPPLY DUCTS CARRY AIR CIRCULATED BY THE FURNACE TO AREAS OUTSIDE THE SPACE CONTAINING THE FURNACE, THE RETURN AIR SHALL ALSO BE HANDLED BY DUCT(S) SEALED TO THE FURNACE CASING AND TERMINATING OUTSIDE THE SPACE CONTAINING THE FURNACE.

⚠️ **WARNING**
WHEN THIS FURNACE IS INSTALLED IN A RESIDENTIAL GARAGE, IT MUST BE INSTALLED SO THE BURNERS AND IGNITION SOURCE ARE LOCATED NO LESS THAN 18 INCHES ABOVE THE FLOOR. THIS IS TO REDUCE THE RISK OF IGNITING FLAMMABLE VAPORS WHICH MAY BE PRESENT IN A GARAGE. ALSO, THE FURNACE MUST BE LOCATED OR PROTECTED TO AVOID PHYSICAL DAMAGE BY VEHICLES. FAILURE TO FOLLOW THESE WARNINGS CAN CAUSE A FIRE OR EXPLOSION, RESULTING IN PROPERTY DAMAGE, PERSONAL INJURY OR DEATH.

⚠️ **WARNING**
DO NOT USE THIS FURNACE DURING CONSTRUCTION IF AIR LADEN CORROSIVE COMPOUNDS ARE PRESENT SUCH AS CHLORINE AND FLUORINE. OTHERWISE, PROVISIONS MUST BE TAKEN TO PROVIDE CLEAN, UNCULTIMATED COMBUSTION AND VENTILATION AIR TO THE FURNACE. FURNACE COMBUSTION AND VENTILATION AIR CONTAMINATED WITH THESE COMPOUNDS FORMS ACIDS DURING COMBUSTION WHICH CORRODES THE HEAT EXCHANGER AND COMPONENT PARTS. SOME OF THESE CONTAMINANTS ARE FOUND IN, BUT NOT LIMITED TO, PANELING, DRY WALL, ADHESIVES, PAINTS, STAINS, VARNISHES, SEALERS, AND MASONRY CLEANING MATERIALS.
GENERAL INFORMATION

The (-)GLH/(-)GLJ and (-)GPH/(-)GPJ series furnaces are design certified by CSA for use with natural and propane gases as follows:

As a Category I furnace, it may be vented vertically with type B-1 vent pipe and also may be common vented as described in these instructions.

LOCATION REQUIREMENTS AND CONSIDERATIONS

GENERAL INFORMATION

⚠️ CAUTION

DO NOT USE THIS FURNACE DURING CONSTRUCTION IF AIR LADEN CORROSIVE COMPOUNDS ARE PRESENT SUCH AS CHLORINE AND FLUORINE. OTHERWISE, PROVISIONS MUST BE TAKEN TO PROVIDE CLEAN, UNCONTAMINATED COMBUSTION AND VENTILATION AIR TO THE FURNACE. FURNACE COMBUSTION AND VENTILATION AIR CONTAMINATED WITH THESE COMPOUNDS FORMS ACIDS DURING COMBUSTION WHICH CORRODES THE HEAT EXCHANGER AND COMPONENT PARTS. SOME OF THESE CONTAMINANTS ARE FOUND IN, BUT NOT LIMITED TO, PANELING, DRY WALL, ADHESIVES, PAINTS, STAINES, VARNISHES, SEALERS, AND MASONRY CLEANING MATERIALS.

1. NOTE: This furnace is shipped with heat exchanger support brackets installed under the back of the heat exchanger. These may be removed before installation, but it is not required.

LOCATION

⚠️ WARNING

THIS FURNACE IS NOT APPROVED FOR INSTALLATION IN A MOBILE HOME. DO NOT INSTALL THIS FURNACE IN A MOBILE HOME. INSTALLATION IN A MOBILE HOME COULD CAUSE FIRE, PROPERTY DAMAGE, PERSONAL INJURY OR DEATH.

2. IMPORTANT: This furnace is not approved or recommended for installation on its back, with access doors facing upwards.

3. This furnace is suitable for installation in buildings constructed on-site. This heating unit should be centralized with respect to the heat distribution system as much as practicable. When installed in a utility room, the door of the room should be wide enough to allow the largest part of the furnace to enter, or to permit the replacement of another appliance, such as a water heater.

4. NOTE: These furnaces are approved for installation in attics, as well as alcoves, utility rooms, closets and crawlspaces.

5. IMPORTANT: Support this unit when installed. For attic or crawl space installation, horizontal furnaces may be installed on combustible wood flooring or by using support brackets. See Figure 1.

6. IMPORTANT: If installing in a utility room, be sure the door is wide enough to:

   a. allow the largest part of the furnace to pass; or
   b. allow any other appliance (such as a water heater) to pass.

© May require 3" to 4" or 3" or 5" adapter.
# May be 0" with type B vent.
• May be 1" with type B vent.

**NOTE:** IN DOWNFLOW CONFIGURATION, OPTIONAL AIR CUTOUT IS NOT PERMITTED.
CLEARANCE—ACCESSIBILITY

The design of forced air furnaces with input ratings as listed in the tables on the following pages are certified by CSA for the clearances to combustible materials shown in inches.

See name/rating plate and clearance label for specific model number and clearance information.

Service clearance of at least 24 inches is recommended in front of all furnaces.

ACCESSIBILITY CLEARANCES, WHERE GREATER, MUST TAKE PRECEDENCE OVER FIRE PROTECTION CLEARANCES.

⚠️ WARNING

UPFLOW AND HORIZONTAL FURNACES MUST NOT BE INSTALLED DIRECTLY ON CARPETING, TILE OR OTHER COMBUSTIBLE MATERIAL OTHER THAN WOOD FLOORING. INSTALLATION ON A COMBUSTIBLE MATERIAL CAN RESULT IN FIRE Causing PROPERTY DAMAGE, SEVERE PERSONAL INJURY OR DEATH.

DOWNFLOW UNIT DESIGN IS CERTIFIED FOR INSTALLATION ON NON-COMBUSTIBLE FLOOR. A SPECIAL COMBUSTIBLE FLOOR SUB-BASE IS REQUIRED WHEN INSTALLING ON A COMBUSTIBLE FLOOR. FAILURE TO INSTALL THE SUB-BASE MAY RESULT IN FIRE, PROPERTY DAMAGE, PERSONAL INJURY OR DEATH. THIS SPECIAL BASE IS OFFERED AS AN ACCESSORY FROM THE FACTORY. SEE THE CLEARANCE LABEL LOCATED INSIDE THE FURNACE FOR THE APPROPRIATE MODEL NUMBER.

THE SPECIAL BASE IS NOT REQUIRED WHEN THE FURNACE IS INSTALLED ON TOP OF AN AIR CONDITIONING PLENUM.

A gas-fired furnace for installation in a residential garage must be installed so that the burner(s) and the ignition source are located not less than 18" above the floor and the furnace is located or protected to avoid physical damage by vehicles.

UPFLOW UNIT DESIGN REQUIRES A SOLID METAL BASE PLATE (SEE TABLE 1 OR FURNACE CLEARANCE LABEL FOR PART NUMBER) BE IN PLACE WHEN THE FURNACE IS INSTALLED WITH SIDE OR REAR AIR RETURN DUCTS. FAILURE TO INSTALL A BASE PLATE COULD CAUSE PRODUCTS OF COMBUSTION TO BE CIRCULATED INTO THE LIVING SPACE AND CREATE POTENTIALLY HAZARDOUS CONDITIONS, INCLUDING CARBON MONOXIDE POISONING.

SITE SELECTION

1. Select a site in the building near the center of the proposed, or existing, duct system.
2. Give consideration to the vent system piping when selecting the furnace location. Be sure the venting system can travel from the furnace to the termination with minimal length and elbows.
3. Locate the furnace near the existing gas piping. Or, if running a new gas line, locate the furnace to minimize the length and elbows in the gas piping.
4. Locate the furnace to maintain proper clearance to combustibles as shown in Figures 2 & 3.

⚠️ CAUTION

WHEN COILS ARE USED WITH AIR HANDLERS OR FURNACES AND INSTALLED ABOVE A FINISHED CEILING OR LIVING AREA, IT IS RECOMMENDED THAT AN AUXILIARY SHEET METAL CONDENSATE DRAIN PAN BE FABRICATED AND INSTALLED UNDER ENTIRE UNIT. FAILURE TO DO SO CAN RESULT IN PROPERTY DAMAGE.

⚠️ WARNING

NEVER ALLOW PRODUCTS OF COMBUSTION OR THE FLUE PRODUCTS TO ENTER THE RETURN AIR DUCTWORK, OR THE CIRCULATING AIR SUPPLY. ALL RETURN DUCTWORK MUST BE ADEQUATELY SEALED AND SECURED TO THE FURNACE WITH SHEET METAL SCREWS, AND JOINTS TAPEd. WHEN A FURNACE IS MOUNTED ON A PLATFORM, WITH RETURN THROUGH THE BOTTOM, IT MUST BE SEALED AIRIGHT BETWEEN THE FURNACE AND THE RETURN AIR PLENUM. THE RETURN AIR PLENUM MUST BE PERMANENTLY ENCLOSED. NEVER USE A DOOR AS A PART OF THE CLEARANCE.

### TABLE 1

</tr>
</tbody>
</table>

DUCTING

Proper air flow is required for the correct operation of this furnace. Too little air flow can cause erratic operation and can damage the heat exchanger. The duct system must carry the correct amount of air for heating and cooling. Position the unit minimize long runs or runs with many turns and elbows.

Size the ducts according to acceptable industry standards and methods. The total static pressure drop (including evaporator coil, if used) of the entire system should not exceed 0.5" w.c. Be sure to have adequate space for unit filter.

IMPORTANT: Some high efficiency filters have a greater than normal resistance to air flow. This can adversely affect furnace operation. BE SURE TO CHECK AIR FLOW if using any filter other than the factory-provided filter.

NOTE: DO NOT take return air from bathrooms, kitchens, furnace rooms, garages, utility or laundry rooms, or cold areas.

⚠️ WARNING

NEVER USE A DOOR AS A PART OF THE CLEARANCE.
THE RETURN AIR PLENUM. THE FLOOR OR PLATFORM MUST PROVIDE SOUND PHYSICAL SUPPORT OF THE FURNACE, WITHOUT SAGGING, CRACKS, GAPS, ETC., AROUND THE BASE AS TO PROVIDE A SEAL BETWEEN THE SUPPORT AND THE BASE.

FAILURE TO PREVENT PRODUCTS OF COMBUSTION FROM BEING CIRCULATED INTO THE LIVING SPACE CAN CREATE POTENTIALLY HAZARDOUS CONDITIONS, INCLUDING CARBON MONOXIDE POISONING THAT COULD RESULT IN PERSONAL INJURY OR DEATH.

DO NOT, UNDER ANY CIRCUMSTANCES, CONNECT RETURN OR SUPPLY DUCTWORK TO OR FROM ANY OTHER HEAT PRODUCING DEVICE SUCH AS A FIREPLACE INSERT, STOVE, ETC. DOING SO MAY RESULT IN FIRE, CARBON MONOXIDE POISONING, EXPLOSION, PERSONAL INJURY OR PROPERTY DAMAGE.

UPFLOW UNITS

1. Set furnace in place and connect the return duct or return air cabinet to unit. Make the connection air-tight to prevent entraining combustion gases from any adjacent fuel-burning appliances. Unit return air may be connected on the sides or bottom of the return air compartment.

   a. Openings in the side must be cut out the full width of the knockouts on the unit. If using side return air, THE BOTTOM base plate must be installed.

   NOTE: Where the maximum airflow is 1800 CFM or more, both sides or the bottom must be used for return air.

   b. If using bottom return air, place furnace over return air plenum and seal furnace bottom to return air plenum.

HORIZONTAL UNITS

1. Position the unit on adequate supports or by using support brackets (see Figure 1) and connect supply plenum.

2. If summer air conditioning is desired, position the indoor coil on the supply air side of the unit. Insure that no air can bypass this coil.

3. Secure the four angle brackets shipped with the unit to the return air opening. See Figure 5. Connect the return air ducting to the return air opening at the top of the unit. Make the connection air tight to prevent entraining combustion gases from an adjacent fuel-burning appliance.

DOWNFLOW UNITS

1. Position the unit over the supply air plenum and connect.

   a. If installing on a combustible floor and not using an evaporator coil box, install the special combustible floor base. See Figure 4.

   b. If summer air conditioning is desired, position the indoor coil on the bottom of the unit. Insure that no air can bypass this coil.

2. Connect the return air ducting to the return air opening at the top of the unit. Make the connection air tight to prevent entraining combustion gases from an adjacent fuel-burning appliance.

FIGURE 4 COMBUSTIBLE FLOOR BASE
COMBUSTION AND VENTILATION AIR

WARNING
THIS FURNACE AND ANY OTHER FUEL-BURNING APPLIANCE MUST BE PROVIDED WITH ENOUGH FRESH AIR FOR PROPER COMBUSTION AND VENTILATION OF THE FLUE GASES. MOST HOMES WILL REQUIRE THAT OUTSIDE AIR BE SUPPLIED INTO THE FURNACE AREA. FAILURE TO DO SO CAN CAUSE DEATH FROM CARBON MONOXIDE POISONING.

Adequate facilities for providing air for combustion and ventilation must be provided in accordance with section 5.3, Air for Combustion and Ventilation, of the National Fuel Gas Code, ANSI, Z223.1 latest edition or CSA B149.1 and .2 or, applicable provisions for the local building codes, and not obstructed so as to prevent the flow of air to the furnace.

OVERTEMPERATURE SAFETY SWITCHES
This furnace is equipped with safety switches in the burner compartment to protect against overtemperature conditions caused by inadequate combustion air supply. The switches are located just above the burners on the furnace center panel on upflow and downflow models and also on each side of the burners on upflow/horizontal and horizontal “only” models, and must be manually reset if tripped. DO NOT jumper this switch. If this switch should trip, a qualified furnace installer, service agency or the gas supplier should be called to check and/or correct for adequate combustion air supply. If this unit is mounted in a closet, the door must be closed when making this check of the installation.

DO NOT reset the overtemperature switch without taking corrective action to assure that an adequate supply of combustion air is maintained under all conditions of operation.

Replace this switch only with the identical replacement part.

COMBUSTION AIR REQUIREMENTS

IMPORTANT: Air for combustion and ventilation must not come from a corrosive atmosphere. Any failure due to corrosive elements in the atmosphere is excluded from warranty coverage.

The following types of installation may require OUTDOOR AIR for combustion, due to chemical exposures:
• Commercial buildings
• Buildings with indoor pools
• Furnaces installed in laundry rooms
• Furnaces in hobby or craft rooms
• Furnaces installed near chemical storage areas.

Exposure to the following substances in the combustion air supply may also require OUTDOOR AIR for combustion:
• Permanent wave solutions
• Chlorinated waxes and cleaners
• Chlorine-based swimming pool chemicals
• Water softening chemicals
• De-icing salts or chemicals
• Carbon tetrachloride
• Halogen type refrigerants
• Cleaning solvents (such as perchloroethylene)
• Printing inks, paint removers, varnishes, etc.
• Hydrochloric acid
• Cements and glues
• Antistatic fabric softeners for clothes dryers
• Masonry acid washing materials
Combustion air must be free of acid forming chemicals; such as sulphur, fluorine and chlorine. These elements are found in aerosol sprays, detergents, bleaches, cleaning solvents, air fresheners, paint and varnish removers, refrigerants and many other commercial and household products. Vapors from these products when burned in a gas flame form acid compounds. The acid compounds increase the dew point temperature of the flue products and are highly corrosive after they condense.

**WARNING**

ALL FURNACE INSTALLATIONS MUST COMPLY WITH THE NATIONAL FUEL GAS CODE AND LOCAL CODES TO PROVIDE ADEQUATE COMBUSTION AND VENTILATION AIR FOR THE FURNACE. FAILURE TO DO SO CAN CREATE HAZARDOUS CONDITIONS RESULTING IN PROPERTY DAMAGE, BODILY INJURY OR DEATH FROM SMOKE, FIRE OR CARBON MONOXIDE.

Combustion air requirements are determined by whether the furnace is in an open (unconfined) area or in a confined space such as a closet or small room.

**EXAMPLE 1. FURNACE LOCATED IN AN UNCONFINED SPACE**

Using indoor air for combustion.

An unconfined space must have at least 50 cubic feet for each 1,000 BTUH of the total input for all appliances in the space. Here are a few examples of the room sizes required for different inputs. The sizes are based on 8' ceilings.

<table>
<thead>
<tr>
<th>BTUH Input</th>
<th>Minimum Sq. Feet With 6' Ceiling</th>
<th>Typical Room Size With 8' Ceiling</th>
</tr>
</thead>
<tbody>
<tr>
<td>50,000</td>
<td>312</td>
<td>14&quot;x24&quot; or 18&quot;x18&quot;</td>
</tr>
<tr>
<td>75,000</td>
<td>469</td>
<td>15&quot;x31&quot; or 20&quot;x24&quot;</td>
</tr>
<tr>
<td>100,000</td>
<td>625</td>
<td>20&quot;x31&quot; or 25&quot;x25&quot;</td>
</tr>
<tr>
<td>125,000</td>
<td>833</td>
<td>23&quot;x34&quot; or 26&quot;x30&quot;</td>
</tr>
<tr>
<td>150,000</td>
<td>938</td>
<td>25&quot;x38&quot; or 30&quot;x31&quot;</td>
</tr>
</tbody>
</table>

If the open space containing the furnace is in a building with tight construction (contemporary construction), outside air may still be required for the furnace to operate and vent properly. Outside air openings should be sized the same as for a confined space.

If combustion air is taken from the heated area, the openings must each have at least 100 square inches of free area. Each opening must have at least one square inch of free area for each 1,000 Btuh of total input in the space. Here are some examples of typical openings required.

<table>
<thead>
<tr>
<th>Btuh Input</th>
<th>Free Area Each Opening</th>
</tr>
</thead>
<tbody>
<tr>
<td>100,000</td>
<td>100 Square Inches</td>
</tr>
<tr>
<td>150,000</td>
<td>150 Square Inches</td>
</tr>
</tbody>
</table>

**EXAMPLE 2. FURNACE LOCATED IN A CONFINED SPACE**

A confined space (any space smaller than shown above as “unconfined”) must have openings into the space which are located in accordance with the requirements set forth in the following subsections A and B. Size the openings by how they are connected to the heated area or to the outside, and by the input of all appliances in the space.

If confined space is within a building with tight construction, combustion air must be taken from outdoors or area freely communicating with the outdoors.

- **A. USING INDOOR AIR FOR COMBUSTION**

  **IMPORTANT**: Air should not be taken from a heated space with a fireplace, exhaust fan or other device that may produce a negative pressure.

  If combustion air is taken from an attic space that is equipped with power ventilation.

  The confined space must communicate with the outdoors according to Methods 1 and 2. The minimum air opening dimension shall not be less than 3 inches. When using ducts, they shall be of the same cross-sectional area as the free area of the openings to which they connect.
IMPORTANT: If the furnace is in a location with an exhaust fan, there must be sufficient ventilation to prevent the exhaust fan from creating a negative pressure in the room. Combustion air openings must NOT BE RESTRICTED in any manner.

CONSULT LOCAL CODES FOR SPECIAL REQUIREMENTS.

Air opening in the furnace casing front, return air grilles, and warm air registers must not be obstructed.

**B: Method 1**

Provide two permanent openings, one located within 12 inches of the top and one located within 12 inches of the bottom of the enclosure. Each opening shall communicate directly, or by ducts, with the outdoors or spaces (crawl or attic) that freely communicate with the outdoors.

a. Where directly communicating with the outdoors or where communicating to the outdoors through VERTICAL DUCTS, each opening shall have a minimum free area of 1 square inch for each 4000 BTUH of total appliance input rating in the enclosure. Here are typical duct sizes:

<table>
<thead>
<tr>
<th>BTUH Input</th>
<th>Free Area Each Opening</th>
<th>Round</th>
<th>Pipe Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>50,000</td>
<td>12.50 sq. inches</td>
<td>4&quot;</td>
<td>4&quot;</td>
</tr>
<tr>
<td>75,000</td>
<td>18.75 sq. inches</td>
<td>5&quot;</td>
<td>5&quot;</td>
</tr>
<tr>
<td>100,000</td>
<td>25.00 sq. inches</td>
<td>6&quot;</td>
<td>6&quot;</td>
</tr>
<tr>
<td>125,000</td>
<td>31.25 sq. inches</td>
<td>7&quot;</td>
<td>7&quot;</td>
</tr>
<tr>
<td>150,000</td>
<td>37.50 sq. inches</td>
<td>7&quot;</td>
<td>7&quot;</td>
</tr>
</tbody>
</table>

b. Where communicating with outdoors through HORIZONTAL DUCTS, each opening shall have a minimum free area of 1 square inch for each 2000 BTUH of total input rating for all equipment in the enclosure. Here are typical duct sizes:

<table>
<thead>
<tr>
<th>BTUH Input</th>
<th>Free Area Each Opening</th>
<th>Round</th>
<th>Pipe Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>50,000</td>
<td>25.00 sq. inches</td>
<td>6&quot;</td>
<td>6&quot;</td>
</tr>
<tr>

</tr>
<tr>
<td>150,000</td>
<td>75.00 sq. inches</td>
<td>10&quot;</td>
<td>10&quot;</td>
</tr>
</tbody>
</table>

**B: Method 2**

One permanent opening, located within 12 inches of the top of the enclosure, shall be permitted where the equipment has clearances of at least 1 inch from the sides and back and 6 inches from the front of the appliance. The opening shall directly communicate with the outdoors or communicate through a vertical or horizontal duct to the outdoors or spaces (crawl or attic) that freely communicate with the outdoors and have a minimum free area of:

a. One square inch for each 3000 BTUH of the total input rating of all equipment located in the enclosure, **AND**

b. Not less than the sum of the areas of all vent connectors in the confined space.

VENTING

GENERAL INFORMATION

The furnace must be vented in accordance with these instructions, National Fuel Gas Code, ANSI Z223.1 and/or the Natural Gas Installation Code, CSA-B149.1 & .2 and requirements or codes of the local utility or other authority having jurisdiction.

WARNING

DEVICES ATTACHED TO THE FLUE OR VENT FOR THE PURPOSE OF REDUCING HEAT LOSS UP THE CHIMNEY HAVE NOT BEEN TESTED AND HAVE NOT BEEN INCLUDED IN THE DESIGN CERTIFICATION OF THIS FURNACE. WE, THE MANUFACTURER, CANNOT AND WILL NOT BE RESPONSIBLE FOR INJURY OR DAMAGE CAUSED BY THE USE OF SUCH UNTESTED AND/OR UNCERTIFIED DEVICES, ACCESSORIES OR COMPONENTS.

DRAFT INDUCER

WARNING

VENT PIPE ATTACHING HOLES MUST BE PREDRILLED IN THE DRAFT INDUCER COLLAR TO PREVENT DAMAGING THE INDUCER. DRILL 1/8" DIAMETER HOLES THROUGH THE VENT PIPE AND COLLAR AND USE #8 SCREWS TO ATTACH. SEE FIGURE 9. FAILURE TO FOLLOW THIS WARNING CAN CAUSE RECIRCULATION OF FLUE PRODUCTS CAUSING CARBON MONOXIDE POISONING RESULTING IN PERSONAL INJURY OR DEATH.

FURNACE CATEGORY INFORMATION

This furnace is shipped as a Category I type induced draft furnace. A Category I furnace operates with a nonpositive vent pressure and has a vent gas temperature at least 140°F above the dew point of the vent gases. A Category I type may be a draft hood equipped furnace or have a fan assisted combustion system (induced draft). The inducer is used to pull flue products through the combustion chamber and as they leave the furnace, most of the energy has been dissipated. The buoyant effect of the flue gases provides venting to the outdoors.

During the off cycle, the inducer is off and there is very little flow through the vent, cooling the vent. During the on cycle there is no dilution airflow, as with a draft hood type furnace. Although the vent heats up rapidly without dilution air, the flue products contain more water vapor, which results in a higher dew point temperature. It is most important that you follow the guidelines in these instructions to prevent the possible formation of condensation in the venting system.

As a Category I furnace it may be vented vertically with type B-1 vent pipe and also may be common vented, as described in these instructions.

IMPORTANT APPLICATION NOTES

When the furnace is used as a replacement, the existing vent system should be inspected to assure that there are no obstructions, blockage, or any signs of corrosion.

NOTE: WHEN THE VENT TABLE PERMITS MORE THAN ONE DIAMETER OF PIPE FOR A CONNECTOR OR VENT, THE SMALLEST PERMITTED DIAMETER MUST BE USED.

VENT PIPE MAY BE TYPE “B-1,” EITHER RIGID OR SUITABLE FLEXIBLE CONSTRUCTION THAT CARRIES A U.L. LISTING.

COMMON VENTING IS ALLOWED WITH VERTICAL B-1 VENT SYSTEMS, AND LINED MASONRY CHIMNEYS. FOLLOW THE NATIONAL FUEL GAS CODE, ANSI Z223.1 AND/OR THE NATURAL GAS INSTALLATION CODE, CSA-B149.1 & .2 FOR PROPER INSTALLATION PRACTICES.

SINGLE WALL VENT CONNECTORS TO “B-1 VENT OR MASONRY CHIMNEYS” MAY BE USED UNDER THE GUIDELINES OF THE NATIONAL FUEL GAS CODE, ANSI Z223.1 AND/OR THE NATURAL GAS INSTALLATION CODE, CSA-B149.1 & .2.

The entire length of the vent connector shall be readily accessible for inspection, cleaning and replacement.
"B-1" VERTICAL VENTING

Type "B-1" vents must be installed in accordance with the terms of their listings and the vent manufacturer’s instructions.

"B-1" vents must be supported and spaced in accordance with their listings and the manufacturer’s instructions. All vents must be supported to maintain their minimum clearances from combustible material.

</table>

*NOTE: All furnaces have a 3" vent connection as shipped from the factory. A 3" to 4" or 3" to 5" vent transition is required on all but the 50,000 BTUH models when vertically vented or common vented with metal vent pipes. THE VENT TRANSITION CONNECTION MUST BE MADE AT THE FURNACE VENT EXIT. It must originate with an adapter if required, at the furnace flue collar and terminate either in a listed cap or roof assembly. When common venting, the vent connector size may differ from the above diameters depending on application. See ANSI Z21.47-1993/CSA-2.3-M93 or latest edition tables.

VERTICAL VENT SYSTEMS:

1. A gas vent shall terminate above the roof surface with a listed cap or listed roof assembly. Gas vents 12 inches in size or smaller with listed caps shall be permitted to be terminated in accordance with Figure 10, provided they are at least 8 feet from a vertical wall or similar obstruction. All other gas vents shall terminate not less than 2 feet above the highest point where they pass through the roof and at least 2 feet higher than any portion of a building within 10 feet.

2. A type B-1 gas vent shall terminate at least 5 feet in vertical height above the highest connected equipment draft hood or flue collar.

3. Must rise ¼" per foot away from the furnace on horizontal runs and be supported with straps or hangers so it has no sags or dips. Supports at 4 foot intervals and at all elbows are recommended.

4. The vent connector must be mechanically fastened to the outlet collar of the furnace with at least (2) sheet metal screws except vent connectors that are B-1 material.

These shall be assembled in accordance with the manufacturer’s instructions. See Figure 9.

5. Any angle greater than 45 degrees from the vertical is considered horizontal. The total horizontal distance of a vent plus the horizontal vent connector serving draft-hood equipped appliances shall not be greater than 75 percent of the vertical height of the vent.

NOTE: Refer to the National Fuel Gas Code, ANSI Z223.1 and/or the Natural Gas Installation Code, CSA-B149.1 & .2.

SPECIAL VENT SYSTEMS (SVS)

IMPORTANT: It is THE FURNACE MANUFACTURER’s position now that new installations of any HTPV pipe used in a category III vent application, including Selkirk’s Selvent™ 11 HTPV product, should cease immediately.
EXISTING VENT SYSTEMS
IMPORTANT RETROFIT VENTING INSTRUCTIONS

If this furnace is a replacement installation, **ALWAYS INSPECT** the existing vent system to be sure there are no obstructions, blockages, or signs of corrosion.

When the existing furnace is removed from a venting system serving other appliances, the venting is likely to be too large to properly vent the remaining attached appliances.

The following steps shall be followed with each appliance that remains connected to the common venting system, while the other appliances that remain connected to the common venting systems are not in operation.

**NOTE:** When the vent table permits more than one diameter of pipe for a connector or vent, the smallest permitted diameter must be used.

1. **Seal any unused openings in the common venting system.**
2. Visually inspect the venting system for proper size and horizontal pitch and determine that there is no blockage, restriction, leakage, corrosion or other deficiencies which could cause an unsafe condition.
3. Insofar as is practical, close all building doors, windows and all doors between the space where the appliances remaining connected to the common venting system are located. Turn on clothes dryers and any appliance not connected to the common venting system. Turn on any exhaust fans, such as range hoods and bathroom exhausts, so they will operate at maximum speed. Do not operate a summer exhaust fan. Close fireplace dampers.
4. Follow the lighting instructions. Place the appliance being inspected into operation. Adjust the thermostat so the appliance will operate continuously.
5. Test for spillage at the draft hood relief opening after 5 minutes of main burner operation. Use the flame of a match or candle, or smoke from a cigarette, cigar, or pipe.
6. After it has been determined that each appliance that remains connected to the common venting system properly vents (when tested as outlined above) return doors, windows, exhaust fans, fireplace dampers and any other gas-burning appliance to their previous conditions of use.
7. If improper venting is observed during any of the above tests, the common venting system must be resized. Refer to National Fuel Gas Code, ANSI Z223.1 and/or the Natural Gas Installation Code, CSA-B149.1 & .2.

POWER VENT SYSTEMS

When vertical venting is not possible, the only acceptable method for horizontal venting is with the use of Tjernlund model GPAK-1TR or Field Controls models SWG-4R power venter. Type B vent pipe and fittings must be used. Common venting is not permitted.

**All application and installation instructions supplied with the power venter must be followed.**

Please address all questions regarding power venter installation, agency listings and furnace model compatibility to:

Tjernlund Products, Inc.

GAS SUPPLY AND PIPING

GAS SUPPLY

⚠️ WARNING ⚠️

THIS FURNACE IS EQUIPPED AT THE FACTORY FOR USE ON NATURAL GAS ONLY. CONVERSION TO LP GAS REQUIRES A SPECIAL KIT SUPPLIED BY THE DISTRIBUTOR OR MANUFACTURER. MAILING ADDRESSES ARE LISTED ON THE FURNACE RATING PLATE, PARTS LIST AND WARRANTY. FAILURE TO USE THE PROPER CONVERSION KIT CAN CAUSE FIRE, CARBON MONOXIDE POISONING, EXPLOSION, PROPERTY DAMAGE, PERSONAL INJURY OR DEATH.

See the conversion kit index supplied with the furnace. This index identifies the proper LP Gas Conversion Kit required for each particular furnace.

IMPORTANT: Any additions, changes or conversions required for the furnace to satisfactorily meet the application should be made by a qualified installer, service agency or the gas supplier, using factory-specified or approved parts. In the commonwealth of Massachusetts, installation must be performed by a licensed plumber or gas fitter for appropriate fuel.

IMPORTANT: Connect this furnace only to gas supplied by a commercial utility.

IMPORTANT: A U.L. recognized fuel gas and CO detector(s) are recommended in all applications, and their installation should be in accordance with the detector manufacturer's recommendations and/or local laws, rules, regulations or customs.

GAS PIPING

Install the gas piping according to all local codes and regulations of the utility company.

If possible, run a separate gas supply line directly from the meter to the furnace. Consult the local gas company for the location of the manual main shut-off valve. The gas line and manual gas valve must be adequate in size to prevent undue pressure drop and never smaller than the pipe size to the combination gas valve on the furnace. Refer to Table 3 for the recommended pipe size for natural gas and Table 4 for LP gas pipe sizes.

IMPORTANT: It is permissible to run flexible gas connector inside the unit to a piece of black pipe. If local codes allow the use of a flexible gas appliance connector, always use a new listed connector. Do not use a connector which has previously serviced another gas appliance. Massachusetts law limits flexible gas connectors to a maximum of 36".

Install a ground joint union inside the cabinet to easily remove the control valve assembly. Install a manual shut-off valve in the gas line outside the furnace casing. The valve should be readily accessible to turn the gas supply on or off. Install a drip leg in the gas supply line as close to the furnace as possible. Always use a pipe compound resistant to the action of liquefied petroleum gases on all threaded connections.

IMPORTANT: When making gas pipe connections, use a back-up wrench to prevent any twisting of the control assembly and gas valve.

Any strains on the gas valve can change the position of the gas orifices in the burners. This can cause erratic furnace operation.

IMPORTANT: ENSURE that the furnace gas control valve not be subjected to high gas line supply pressures.

DISCONNECT the furnace and its individual shut-off valve from the gas supply piping during any pressure testing that exceeds 1/2 PSIG (3.48 kPa).
**GAS PRESSURE**

**IMPORTANT:** The maximum gas supply pressure to the furnace should be 10.5" w.c. for natural gas and 13" w.c. for LP gas.

Natural gas supply pressure should operate between 5" to 10.5" w.c. LP gas supply pressure should be 11" to 13" w.c. This pressure must be maintained with all other gas-fired appliances in operation.

**NOTE:** Do not exceed a gas pressure of 13" w.c.

---

**WARNING**

NEVER PURGE A GAS LINE INTO THE COMBUSTION CHAMBER. NEVER USE MATCHES, FLAME OR ANY IGNITION SOURCE FOR CHECKING LEAKAGE. FAILURE TO FOLLOW THIS WARNING CAN CAUSE AN EXPLOSION OR FIRE RESULTING IN PROPERTY DAMAGE, PERSONAL INJURY OR DEATH.

To check for gas leakage, use an approved chloride-free soap and water solution, an electronic combustible gas detector, or other approved method.

Orifice size information is shown on the table below:

---

**LP CONVERSION**

**NOTE:** For installation, see specific LP kit installation instructions.

The valve can be converted to use liquefied petroleum (LP) gas by replacing the pressure regulator spring with the conversion kit spring. This LP kit spring allows the regulator to maintain the proper manifold pressure for LP gas. The correct burner LP orifices are included in the kit.

**NOTE:** Order the correct LP conversion kit from the furnace manufacturer. Furnace conversion to LP gas must be performed by a qualified technician.

---

**NOx MODELS**

When converting furnaces equipped with NOx inserts to LP gas, remove the NOx insert assemblies. Steps for removal are listed below:

1. Turn off all electrical power and the gas supply to the furnace.
2. Remove the burner door from the furnace.
3. Remove the igniter assembly – handle with care.
4. Remove the two screws attaching the NOx insert retainer brackets to the center panel. Pull the retainer rod.
5. Put the two screws back into the holes in the center panel.
6. Re-install the igniter and burner assemblies.
7. Replace burner door.
8. Turn on electrical power and gas supply to the unit.
**SETTING GAS PRESSURE**

The maximum gas supply pressure to the furnace should be 10.5" w.c. natural gas, or 13" w.c. LP gas. The minimum supply gas pressure to the gas valve should be 5" w.c. natural gas or 11" w.c. LP gas. A properly calibrated manometer is required for accurate gas pressure measurements.

**Supply Gas Pressure Measurement.**

A line pressure tap is on the inlet side of the gas valve.

1. With gas shut off to the furnace at the manual gas valve outside the unit, remove the input pressure tap plug.
2. Connect a U-Tube manometer to the pressure tap. See Figure 13.
3. Turn on the gas supply and operate the furnace and all other gas-fired units on the same gas line as the furnace.
4. Adjust the line gas pressure to supply:
   A. 5" - 10.5" w.c. for natural gas.
   B. 11" - 13" w.c. for LP gas.
5. Shut off the gas at the manual gas valve and remove the U-Tube manometer.
6. Replace the pressure tap plug before turning on the gas.

**NATURAL GAS:**

If the supply gas line pressure is above the operating range, install an in-line gas regulator to the furnace. If supply gas line pressure is below the operating range, either remove any restrictions in the gas supply piping or enlarge the gas pipe. See Tables 3.

**LP GAS:**

If the supply gas line pressure is above the operating range, have the LP supplier reduce the line pressure at the regulator. If supply gas line pressure is below operating range, have the LP supplier adjust the line pressure at the regulator. See Table 4.

**NOTE:** Depending on the amount of LP vapor and the outdoor ambient temperature, the LP storage tank may require supplemental heat to maintain proper pressure levels.

After the length of pipe has been determined, select the pipe size which will provide the minimum cubic feet per hour required for the gas input rating of the furnace. By formula:

\[
\text{Cu. Ft. Per Hr. Required} = \frac{\text{Gas Input of Furnace (BTU/HR)}}{\text{Heating Value of Gas (BTU/FT3)}}
\]

The gas input of the furnace is marked on the furnace rating plate. The heating value of the gas (BTU/FT3) may be determined by consulting the local natural gas utility or the LP gas supplier.

Example (LP): Input BTU requirement of unit, 150,000

Equivalent length of pipe, 60 ft. = 3/4" IPS required.
ADJUSTING OR CHECKING FURNACE INPUT

NATURAL GAS:
The maximum gas supply pressure to the furnace should be 10.5” W.C. for natural gas. The minimum gas supply pressure for purposes of input adjustment to the furnace should be 5” W.C.

A properly calibrated manometer or gauge is required for accurate gas pressure readings.

The manifold pressure should be set at 3.5” W.C. for natural gas. Only small variations in the gas flow should be made by means of the pressure regulator adjustment.

To adjust the pressure regulator:
1. Remove the regulator cap.
2. Turn the adjustment screw clockwise to increase pressure or counterclockwise to decrease pressure.
3. Replace the regulator cap securely.

LP GAS:
Furnaces for use on LP gas, the LP gas supply pressure must be set between 11.0” and 13.0” W.C. by means of the tank or branch supply regulators. The furnace manifold pressure should be set at 10” W.C. at the gas control valve. For elevations up to 8,000 feet, rating plate input ratings apply. For high altitudes (elevations 8,000 and over) and for any necessary major changes in the gas flow rate the orifice spud must be changed.

TO CHANGE ORIFICE SPUDS:
1. Shut off the manual main gas valve and remove the gas manifold.
2. Replace the orifice spuds.
3. Reassemble in reverse order.
4. Turn the gas supply back on and check for proper operation and manifold pressure.

Check of input is important to prevent over firing of the furnace beyond its design-rated input. NEVER SET INPUT ABOVE THAT SHOWN ON THE RATING PLATE.

TO CHECK FURNACE INPUT:
1. Make certain that all other gas appliances are shut off, with the exception of pilot burners.
2. Start the furnace
3. Time the meter to measure the time required to burn one cubic foot of gas.
4. Use Table 6 to determine input rate.

**ALTERNATE METHOD FOR CANADIAN HIGH-ALTITUDE DERATE**

In Canada, unless an orifice change is specifically mandated by local codes, an alternate method of altitude deration through a reduction in manifold pressure is acceptable as described in Table 5. This information is based on a heating value of 1000 BTU per cubic feet of natural gas, and 2500 BTU per cubic feet of LP gas.

**IMPORTANT:** Actual input rates must be measured onsite with manifold pressure adjustment to ensure that an actual 10% reduction in input rate is achieved.

Once this field adjustment has been made, the label shown in Figure 14 must be affixed in a conspicuous location on the front of the furnace cabinet.

**NOTE:** This label is supplied in the information packet shipped with each furnace.

---

Time in Seconds (for 1 cu.ft.) of Gas =
**ELECTRICAL WIRING**

**WARNING**

TURN OFF ELECTRIC POWER AT THE FUSE BOX OR SERVICE PANEL BEFORE MAKING ANY ELECTRICAL CONNECTIONS.

ALSO, THE GROUND CONNECTION MUST BE COMPLETED BEFORE MAKING LINE VOLTAGE CONNECTIONS. FAILURE TO DO SO CAN RESULT IN ELECTRICAL SHOCK, SEVERE PERSONAL INJURY OR DEATH.

IMPORTANT: The furnace must be installed so that the electrical components are protected from water (furnace condensate).

**ELECTRICAL CONNECTIONS**

**WARNING**

THE CABINET MUST BE PERMANENTLY GROUNDED. A GROUND SCREW IS PROVIDED IN THE JUNCTION BOX FOR THIS PURPOSE. FAILURE TO DO SO CAN RESULT IN FIRE, ELECTRICAL SHOCK, PERSONAL INJURY OR DEATH.

The electrical supply requirements are listed on the furnace rating plate.

Use a separate fused branch electrical circuit containing a properly sized fuse or circuit breaker. Run this circuit directly from the main switch box to an electrical disconnect which must be readily accessible and located within sight of the furnace. Connect from the disconnect to the junction box on the left side of the furnace, inside the control compartment. See appropriate wiring diagram.

**NOTE:** The electrical junction box inside the furnace control compartment may be relocated to the right side if necessary. A knockout is provided.

**NOTE:** L1 (hot) and L2 (neutral) polarity must be observed when making field connections to the furnace. The ignition control on electric ignition models will not sense flame if L1 and L2 are reversed.

Installation of the electric supply line should be in accordance with the National Electric Code ANSI/NFPA No. 70, latest edition, or Canadian Electrical Code Part 1 - CSA Standard C22.1 and local building codes.

This can be obtained from:

National Fire Protection Association
Batterymarch Park
Quincy, MA 02269

Etobicoke (Toronto), Ontario
Canada M9W, 1R3

---

**THERMOSTAT**

The room thermostat must be compatible with the integrated furnace control on the furnace. All thermostats available from the furnace manufacturer’s Parts Department are acceptable. Generally, all thermostats that are not of the “current robbing” type are compatible with the integrated furnace control used.

**NOTE:** An isolation relay may assist with “current robbing” type thermostat compatibility problems. Use a single-pole, single-throw relay with a 24-volt AC coil. The contacts should be rated for .5 amps minimum at 24 volts. See Figure 15.

Install the room thermostat in accordance with the instruction sheet in the box with the thermostat. Run the thermostat lead wires inside the control compartment. Connect the thermostat as shown on the wiring diagram. Never install the thermostat on an outside wall or where it will be influenced by drafts, concealed hot or cold water pipes, lighting fixtures, radiation from fireplace, rays of sun, lamps, television, radios or air streams from registers. Refer to the instructions packed with the thermostat for best anticipator adjustment or selection or see below.

**HEAT ANTICIPATOR SETTINGS**

For adjusting the thermostat heat anticipator setting; (a) add the current draw of the various components in the system or (b) using jumper wire, measure the current flow between the R and W thermostat circuits. Set the thermostat heat anticipator according to the current flow measured.
FIELD INSTALLED OPTION ACCESSORIES

ELECTRONIC AIR CLEANER
1. Electronic air cleaner line voltage power can be supplied from the screw terminal “EAC” and a line voltage neutral screw terminal on the control board. See Figure 16.

NOTE: For (-)GPJ and (-)GLJ units spade terms only are provided for E.A.C. and humidifier. This will power the electronic air cleaner whenever the circulating air blower is in operation.

HUMIDIFIER
((-)GPH & (-)GLH MODELS ONLY)
2. Humidifier line voltage power can be supplied from screw terminal “HUM” to a line voltage neutral screw terminal on the control board. See Figure 16. This will power the humidifier whenever the inducer is operating in the heating mode.

NOTE: (-)GPJ and (-)GLJ models do not have an output for a humidifier.

NOTE: Maximum current –1.0 amps for each option.

FURNACE TWINNING INSTALLATIONS

IMPORTANT: TWINNING OF (-)GPJ, AND (-)GLJ UNITS REQUIRES AN ACCESSORY TWINNING KIT. REFER TO THE FURNACE SPECIFICATION SHEET FOR PROPER KIT. DO NOT ATTEMPT TO TWIN THESE MODELS BY USING THE INSTRUCTIONS BELOW.

IMPORTANT: ONLY TWIN FURNACES WITH IDENTICAL CONTROL BOARDS.

IMPORTANT: ONLY BOTTOM RETURNS CAN BE USED. NO MORE THAN TWO FURNACES CAN SHARE THE SAME SUPPLY AND RETURN. FURNACES MUST HAVE SAME HEATING AND BLOWER CAPACITY. TWINNING FURNACES MUST OPERATE OFF THE SAME PHASE OF POWER.

Twinning operation of two furnaces, installed side-by-side, connected by a common duct system with main power supplied by the same source, and controlled by a common thermostat can be done with the UT ELECTRONIC CONTROLS 1028-928 integrated control boards.

The “OK” LED will flash if twinning is not set up properly.

UTEC 1028-928 CONTROL BOARD, TWINNING CONNECTION -- TWO-STAGE OPERATION
START-UP PROCEDURE

LIGHTING INSTRUCTIONS

This appliance is equipped with either a direct spark ignition device or a hot surface silicon carbide ignition device. This device lights the main burners each time the room thermostat (closes) calls for heat. See lighting instructions on the furnace.

TO START FURNACE

1. Set the thermostat to the lowest setting.
2. Turn off all electric power to the appliance.
3. Set the thermostat to lowest setting. 
4. Move switch to the "OFF" position.
5. Remove control door.
6. Move switch to the "OFF" position.

WARNING

1. BE SURE THAT THE MANUAL GAS CONTROL HAS BEEN IN THE "OFF" POSITION FOR AT LEAST FIVE MINUTES. DO NOT ATTEMPT TO MANUALLY LIGHT THE MAIN BURNERS. FAILURE TO FOLLOW THIS WARNING CAN CAUSE A FIRE OR AN EXPLOSION RESULTING IN PROPERTY DAMAGE, PERSONAL INJURY OR DEATH.
2. Set the thermostat to lowest setting.
3. Turn off all electric power to the appliance.
4. This appliance does not have a pilot. It is equipped with an ignition device which automatically lights the burner. Do NOT try to light the burner by hand.
5. Remove control door.
6. Move switch to the "OFF" position.

NOTE: USE only your hand to move the gas control switch. Never use tools. If the switch will not move by hand, don’t try to repair it; call a qualified service technician. Force or attempted repair may result in a fire or explosion.

7. Wait five (5) minutes to clear out any gas. Then smell for gas, including near the floor. If you smell gas, STOP! Follow the safety instructions on the front page of this manual. If you don’t smell gas, go to the next step.

8. Move switch from "OFF" position to "ON" position.
9. Replace control door.
10. Turn on all electric power to the appliance.
11. Set the thermostat to desired setting.
12. If the appliance will not operate, follow the instructions below to shut down furnace and call your service technician or gas supplier.

TO TURN OFF GAS TO FURNACE

1. Set the thermostat to the lowest setting.
2. Turn off all electric power to the appliance if service is to be performed.
3. Remove control door.
4. Move switch to the "OFF" position.
5. Replace control door.

WARNING

SHOULD OVERHEATING OCCUR OR THE GAS SUPPLY FAIL TO SHUT OFF, SHUT OFF THE MANUAl GAS VALVE TO THE APPLIANCE BEFORE SHUTTING OFF THE ELECTRICAL SUPPLY. FAILURE TO DO SO CAN CAUSE AN EXPLOSION OR FIRE RESULTING IN PROPERTY DAMAGE, PERSONAL INJURY OR DEATH.

SEQUENCE OF OPERATION

UT Electronic Controls Direct Spark Ignition

1. Each time the thermostat contacts close, the induced draft blower (inducer) begins a prepurge cycle.
2. The air proving negative pressure switch(es) closes.
3. 30 seconds after the pressure switch(es) close, the spark igniter energizes. The induced draft blower operates for the complete heating cycle.
4. After the spark igniter energizes, the gas valve opens for a 8-second trial for ignition.
5. The igniter lights the gas burners.
6. After the gas valve opens the flame sensor must prove flame ignition for one second using the process of flame rectification. If the burners don’t light, the system goes through another ignition sequence. It does this up to four times.
7. The main blower starts 20 seconds after the burners ignite.
8. When the thermostat cycle ends, the gas valve closes, the burners go out, the induced draft blower stops after a 5-second post-purge, and the negative pressure switch(es) open.
9. The main blower continues until timed off by the setting on the integrated furnace control board.

Sequence if the system doesn’t light or doesn’t sense flame:

1. On a call for heat, the control runs the inducer for 30 seconds to pre purge.
2. After the 30-second pre-purge, the spark igniter energizes. The inducer continues to run.
3. After the spark igniter energizes, the gas valve opens for a 8-second trial for ignition. The inducer continues and the igniter stays energized.
4. If flame is not sensed within 8 seconds after the gas valve opens, the gas valve closes, and the igniter de-energizes.
5. After a 30-second inter-purge, the igniter is energized, the gas valve opens for 8 seconds. If no flame is sensed, it closes the gas valve, the igniter de-energizes. Both the main blower and the inducer operate for 180 seconds before the next ignition trial.

b. It retries up to four times. At the end of the last try, the inducer stops. The system is in "soft" lock out.
7. The above sequence will repeat after a one hour delay. It will continue repeating until ignition is successful or the call for heat is terminated.
8. To reset the lock out, make and break power either at the thermostat or at the unit disconnect switch for 5 to 10 seconds. It then goes through another set of trials for ignition.

UT Electronic Controls Integrated Controls with Hot Surface Ignition.

1. Each time the thermostat contacts close, the induced draft blower (inducer) begins a prepurge cycle.
2. The air proving negative pressure switch(es) closes.
3. 5 seconds after the pressure switch(es) close, the hot surface igniter begins heating for 30 seconds to full temperature. The induced draft blower operates for the complete heating cycle.
4. After the 30-second igniter warm up, the gas valve opens for an 8-second trial for ignition.
5. The igniter lights the gas burners and stays energized for the first 8 seconds after the gas valve opens.
6. 7 seconds after the gas valve opens the remote flame sensor must prove flame ignition for one second using the process of flame rectification. If the burners don’t light, the system goes through another ignition sequence. It does this up to four times.
7. The main blower starts 20 seconds after the burners ignite.
8. When the thermostat cycle ends, the gas valve closes, the burners go out, the induced draft blower runs for a 5-second post-purge, and the negative pressure switch(es) open.
9. The main blower continues until timed off by the setting on the integrated furnace control board.

Sequence if the system doesn’t light or doesn’t sense flame:

1. On a call for heat, the control runs the inducer for 30 seconds to pre purge.
2. 5 seconds into prepurge, the hot surface igniter begins heating for 30 seconds. The induced draft blower runs for a 5-second post-purge, and the negative pressure switch(es) open.
3. The main blower continues until timed off by the setting on the integrated furnace control board.

Sequence if the system doesn’t light or doesn’t sense flame:

1. On a call for heat, the control runs the inducer for 30 seconds to pre purge.
2. 5 seconds into prepurge, the hot surface igniter begins heating for 30 seconds. The inducer continues to run.
3. After the 30-second pre-purge, the spark igniter energizes. The burners go out, the induced draft blower runs for a 5-second post-purge, and the negative pressure switch(es) open.
4. The main blower continues until timed off by the setting on the integrated furnace control board.

Sequence if the system doesn’t light or doesn’t sense flame:

1. On a call for heat, the control runs the inducer for 30 seconds to pre purge.
2. 5 seconds into prepurge, the hot surface igniter begins heating for 30 seconds. The inducer continues to run.
3. After the 30-second igniter warm up, the gas valve opens for an 8-second trial for ignition. The inducer continues and the igniter stays energized.
4. If flame is not sensed during the 8th second after the gas valve opens, the gas valve closes, and the igniter de-energizes.
5. After 5 seconds of inter-purge, the igniter heats for 30 seconds. After 30 seconds, the gas valve opens for 9 seconds. If no flame is sensed, it closes the gas valve, the igniter de-energizes. Both the main blower and the inducer operate for 180 seconds before the next ignition trial.

6. It repeats this process up to four times. At the end of the last try, the inducer stops immediately. The system is in “soft” lock out for one hour.

7. The above sequence will repeat after a one hour delay. It will continue repeating until ignition is successful or the call for heat is terminated.

8. To reset the lock out, make and break power either at the thermostat or at the unit disconnect switch for 5 to 10 seconds. It then goes through another set of trials for ignition.

**SETTING BLOWER TIMINGS**

The UT Electronic Controls control boards have four quick connect terminals for connecting the motor speed leads. These are:

1. **FAN SPEED** — motor runs on this speed when the thermostat is in the “FAN” position.
2. **COOL** — connect desired cooling speed.
3. **HEAT** — connect desired heating speed.
4. **HEAT/COOL** — connect desired speed when heating and cooling speed are the same.

**NOTE:** This tap not available on (-)GPJ or (-)GLJ.

**IMPORTANT:** Do not connect any motor speeds to “HEAT” or “COOL” if you use the “HEAT/COOL” terminal.

5. If heating and continuous speed are the same, jump across “FAN” and “HEAT” terminals.

**NOTE:** This does not apply to (-)GPJ or (-)GLJ models because the heat tap functions as the continuous fan tap as well.

See Figures 19, 20 & 21 for instructions for setting the blower “OFF” timings.

---

**WARNING**

**DISCONNECT THE ELECTRICAL SUPPLY TO THE FURNACE BEFORE ATTEMPTING TO CHANGE THE BLOWER SPEED. FAILURE TO DO SO CAN CAUSE ELECTRICAL SHOCK RESULTING IN SEVERE PERSONAL INJURY OR DEATH.**

The blower motor is wired for blower speeds required for normal operation as shown.

If additional blower speed taps are available (leads connected to “M1” and “M2” on the electronic control), speeds may be changed if necessary to fit requirements of the particular installation. Reconnect the unused motor leads to “M1” or “M2.” Check motor lead color for speed designation.

Heating speeds should not be reduced where it could cause the furnace air temperature to rise to exceed the maximum outlet air temperature specified for the unit.

**IMPORTANT:** Always check air temperature rise after changing the heating speed for any reason.

AIR FLOW

The importance of proper air flow over the heat exchanger cannot be overemphasized. One of the most common causes of heat exchanger failure is overheating due to low air flow. An air flow table is located inside the blower door and on the following pages.

TEMPERATURE RISE CHECK

To determine if the air flow is correct, make a temperature rise check.

1. Insert a thermometer in the supply air duct as close to the furnace as possible yet out of a direct line from the heat exchanger. See Figure 22.

2. Insert a thermometer in the return air duct as close to the furnace as possible.

3. Operate the furnace.

4. When the thermometer in the supply air duct stops rising (approximately five minutes), subtract the return air temperature from the supply air temperature. The difference is the temperature rise.

5. Compare the measured temperature rise to the approved temperature rise range listed on the furnace name plate. See Figure 23.

If the measured temperature rise is above the approved range, the air flow is too low. More air must be moved by speeding up the blower, by removing restrictions in the duct system, or by adding more supply or return air duct. If the measured temperature rise is below the approved range, the air flow is too much. Use lower speed tap on the multi-speed blower.

Ideally the measured temperature rise should be in the middle of the range.

IMPORTANT: Some high-efficiency filters have a greater than normal resistance to airflow. This can adversely affect furnace operation. BE SURE TO CHECK AIRFLOW if using any filter other than factory-provided filter.

</tbody>
</table>
LIMIT CONTROL
The high limit cut-off temperature is set at the factory and cannot be adjusted. The temperature setting prevents the air temperature leaving the furnace from exceeding the maximum outlet air temperature, which, if exceeded, will shut the furnace down. Some reasons which could cause the outlet temperature to exceed the range include: failed indoor blower, dirty filters, etc.

OVER TEMPERATURE SAFETY SWITCHES
Furnaces are equipped with safety switches to protect against overtemperature conditions in the burner compartment, which, if tripped, will terminate the heating cycle. In the event of an overtemperature condition, the switch will shut the furnace down. The switch for the dedicated UPFLOW FURNACE and DOWNSLANT is located just above the burners on the blower divider panel. Switches for the UPFLOW/HORIZONTAL FURNACES are located on either side of the burner brackets and just above the burners on the blower divider panel. If a switch is tripped, it must be manually reset. DO NOT jumper or reset this switch. If this switch should trip, a qualified installer, service agency or the gas supplier should be called to diagnose and/or correct the source of tripping. If this unit is mounted in a closet, the door must be closed when making this check.

PRESSURE SWITCH
This furnace is equipped with a normally-open pressure switch that monitors pressure conditions within the furnace vent system during the heating cycle.
Replace only with a switch with identical settings. Replacement of the pressure switch is not required at high altitudes.

LUBRICATION
The indoor blower motor and induced draft motor are prelubricated by the motor manufacturer and do not require further attention.
The motors must be cleaned periodically by a qualified installer, service agency, or the gas supplier to prevent the possibility of overheating due to an accumulation of dust and dirt on the windings or on the motor exterior. Air filters should be kept clean. Dirty filters can restrict airflow and results in motor overheating.
Reference Figure 24 for proper removal of the blower assembly on downflow models.

SAFETY FEATURES

FIGURE 24
DOWNFLOW BLOWER REMOVAL
**MAINTENANCE**

**WARNING**

Disconnect main electrical power to the unit before attempting any maintenance. Failure to do so can cause electrical shock resulting in severe personal injury or death.

**FILTERS**

**NOTE:** (-)GPJ, and (-)GLJ models are not factory equipped with filters. Filters must be field installed.

Keep the air filters clean at all times. Vacuum dirt from filter, wash with detergent and water, air dry thoroughly and reinstall.

See Table 7 and Figures 25, 26, 27, and 28 for proper filter sizes and locations.

1. 14”-50,000 BTUH unit requires removal of 3½” segment of filter and frame to get proper width for a bottom filter.

2. 21”-100,000 BTUH unit requires removal of 3½” segment of filter and frame to get proper width for a side filter.

3. 24½”-125,000 and 150,000 BTUH units require removal of 7” segment of filter and frame to get proper width for a side filter.

*NOTE:* Some filters must be resized to fit certain units and applications.

---

*SOLID BOTTOM MAY BE ORDERED AS AN OPTION FROM THE FACTORY.*
FIGURE 27
FILTER RETAINING ROD (SIDE RETURN)

FIGURE 28
DOWNFLOW FILTER INSTALLATION
IMPORTANT: Do not operate the system for extended periods without filters. A portion of the dust entrained in the air may temporarily lodge in the air duct runs and at the supply registers. Any recirculated dust particles will be heated and charred by contact with the furnace heat exchanger. This residue will soil ceilings, walls, drapes, carpets, and other household articles.

SYSTEM OPERATION INFORMATION

Advising the Customer To:

1. Keep the air filters clean. The heating system will operate better, more efficiently and more economically.
2. Arrange the furniture and drapes so that the supply air registers and the return air grilles are unobstructed.
3. Close doors and windows. This will reduce the heating load on the system.
4. Avoid excessive use of kitchen & bathroom exhaust fans.
5. Do not permit the heat generated by television, lamps or radios to influence the thermostat operation.
6. Except for the mounting platform, keep all combustible articles three feet from the furnace and vent system.
7. IMPORTANT: Replace all blower doors and compartment covers after servicing the furnace. Do not operate the unit without all panels and doors securely in place.
8. Proper operation of the system with constant air circulation.

WARNING

COMBUSTIBLE MATERIAL MUST NOT BE PLACED ON OR AGAINST THE FURNACE JACKET OR WITHIN THE SPECIFIED CLEARANCES OF THE VENT PIPE. THE AREA AROUND THE FURNACE MUST BE KEPT CLEAR AND FREE OF ALL COMBUSTIBLE MATERIALS INCLUDING GASOLINE AND OTHER FLAMMABLE VAPORS AND LIQUIDS. PLACEMENT OF COMBUSTIBLE MATERIALS ON, AGAINST OR AROUND THE FURNACE JACKET CAN CAUSE AN EXPLOSION OR FIRE RESULTING IN PROPERTY DAMAGE, PERSONAL INJURY OR DEATH. THE FURNACE OWNER SHOULD BE CAUTIONED THAT THE FURNACE AREA MUST NOT BE USED AS A BROOM CLOSET OR FOR ANY OTHER STORAGE PURPOSES.

ANNUAL INSPECTION

The furnace should operate for many years without excessive scale build-up in the flue passageways, however, it is recommended that a qualified installer, service agency, or the gas supplier actually inspect the flue passageways, the vent system and the main and pilot burners for continued safe operation paying particular attention to deterioration from corrosion or other sources.

WARNING

HOLES IN THE VENT PIPE OR HEAT EXCHANGER CAN CAUSE TOXIC FUMES TO ENTER THE HOME RESULTING IN CARBON MONOXIDE POISONING OR DEATH. THE VENT PIPE OR HEAT EXCHANGER MUST BE REPLACED IF THEY LEAK.

If during inspection the flue passageways and vent system are determined to require cleaning, the following procedures should be followed (by a qualified installer, service agency, or gas supplier):
1. Turn off electrical power to the furnace and set the thermostat lever to the lowest temperature.
2. Shut off the gas supply to the furnace either at the meter or at a manual valve in the supply piping.
3. Remove burner door. On downflow models, the blower door and burner door flange must also be removed.
4. Disconnect gas supply piping from gas valve.
5. Remove screws (4) connecting the burner tray to the center panel.
6. Disconnect wiring to the gas valve. Make sure to mark all wires disconnected for proper reconnection.
7. Remove burner tray and manifold assembly from the unit.
8. Remove all screws in the unit top plate. Remove the top plate along with connecting pressure switch from the unit.
9. Remove screws connecting draft inducer to center panel. Also remove wiring to draft inducer at this time.
10. Remove screws (11) on perimeter of heat exchanger. If hot surface ignition is present, remove the connecting screws along with associated wiring at this time.
11. In an upward and forward motion, lift heat exchanger from the unit.
12. Flush each heat exchanger tube with water from a hose and blow out with air to remove excessive moisture. If heat exchanger is blocked, especially with soot, and cannot be flushed, it must be replaced.
13. Reassemble (steps 1 through 11 in reverse order.

• IMPORTANT: It is recommended that at the beginning of the heating season and approximately midway in the heating season a visual inspection be made of the main burner flames and pilot flame on standing pilot models for the desired flame appearance by a qualified installer, service agency, or the gas supplier.

• IMPORTANT: It is also recommended that at the beginning of the heating season, the flame sensor on hot surface ignition models be cleaned with steel wool by a qualified installer, service agency, or the gas supplier.

• IMPORTANT: It is recommended that an annual inspection and cleaning of all furnace markings be made to assure legibility. Attach a replacement marking, which can be obtained through the distributor, if any are found to be illegible or missing.

IMPORTANT: FOR Nox MODELS - At the beginning of the heating season a visual inspection of the Nox device should be made to ensure they have not become obstructed by insects nests or anything else which may effect performance.

REPLACEMENT PARTS

Contact your local distributor for a complete parts list. See enclosed sheet.

TROUBLESHOOTING

Refer to Figure 29 for determining cause of unit problems.

WIRING DIAGRAM

Figures 30 and 31 are complete wiring diagrams for the furnace and power sources.
FIGURE 29
TROUBLESHOOTING FLOWCHART

WARNING
HAZARDOUS VOLTAGE
DISCONNECT POWER BEFORE SERVICING.
LINE VOLTAGE
SERVICE MUST BE BY A TRAINED, QUALIFIED
CONNECTIONS
SERVICE TECHNICIAN.

INTEGRATED FURNACE CONTROL (IFC)
TROUBLESHOOTING GUIDE

START
1. SET FAN SWITCH TO AUTO
2. SET THERMOSTAT TO CALL FOR HEAT

PREPURGE

INDUCED DRAFT MOTOR STARTS

CHECK FOR 120 VAC AT INDUCER
YES
REPLACE INDUCER

CHECK FOR 120 VAC AT
IFC'S INDUCER OUTPUT
NO
YES
REPLACE AUXILIARY TEMP
SWITCH IF WIRING IS OK AND
THE HEAT EXCHANGER IS COOL

EXAMINE IFC POWER LED AND ANY FLASH
CODES FROM "OK" LED, IS POWER LED ON?
YES
NON
"OK" LED ON? NOTE: "OK" LED MAY FLASH 1 OF 5
FAULT CODES: 1 OR 4 ON ECONOMY MODELS

CHECK FOR LINE VOLTAGE
CHECK FOR LOW VOLTAGE FROM TRANSFORMER
CHECK ANY IN LINE OR BOARD MOUNTED FUSE

REPLACE IFC

CHECK FOR 24 VAC FROM
"W" TO "C" ON IFC
NO
YES
CHECK THERMOSTAT WIRING

REPLACE VENT
PRESSURE SWITCH

NO
YES

CHECK ALL WIRING TO AND FROM IFC. IS VENT PRESSURE SWITCH OPEN?
NOTE: UPON A CALL FOR HEAT, THE IFC WILL FIRST MAKE SURE THE VENT PRESSURE SWITCH
IS OPEN. IF OPEN, IT WILL THEN TURN INDUCER ON. OTHERWISE, IT WILL WAIT FOR SWITCH TO CLOSE.

IF THE VENT PRESSURE SWITCH DOES NOT CLOSE WITHIN 60 SEC., THE IDM WILL STOP FOR 5 MIN.
AND RETRY. DOES IDM RECYCLE IN THIS MANNER EVERY 5 MIN? I

SPARK OR HOT SURFACE
IGNITER ENERGIZES

CHECKING TO IGNITER
FOR DIRECT SPARK IGNITION, CHECK FOR SPARKING BETWEEN IGNITER ELECTRODES.
FOR HOT SURFACE IGNITION, CHECK 120 VAC AT IGNITER AND AT IFC IGNITER
OUTPUT DURING IGNITER WARMUP, IS SPARKING OR HOT SURFACE VOLTAGE PRESENT?

CHECK FOR BLOCKED VENT. CHECK VENT PRESSURE SWITCH. IS VENT PRESSURE SWITCH CLOSED?
NO
YES

REPLACE IGNITER

NO
YES

NOTE: MAKE SURE DIRECT
SPARK ELECTRODES ARE
POSITIONED SO THEY DO
NOT SPARK TO BURNER
ASSEMBLY BEFORE REPLACING

REPLACE IFC IF ALL WIRING CONNECTIONS HAVE BEEN CONFIRMED

(continued on next page)
FIGURE 29
TROUBLESHOOTING FLOWCHART (CONTINUED)

NOTE:
- STATIC DISCHARGE CAN DAMAGE INTEGRATED FURNACE CONTROL (IFC)
  - "OK" LED BLINKS TO INDICATE THESE EXTERNAL FAULTS:
    1. BLINK FOLLOWED BY A 2 SEC. PAUSE - 1 HOUR LOCKOUT
    2. BLINKS FOLLOWED BY A 2 SEC. PAUSE - PRESSURE SWITCH IS OPEN
    3. BLINKS FOLLOWED BY A 2 SEC. PAUSE - LIMIT SWITCH IS OPEN
    4. BLINKS FOLLOWED BY A 2 SEC. PAUSE - PRESSURE SWITCH CLOSED
    5. BLINKS FOLLOWED BY A 2 SEC. PAUSE - FAULT.

CHECK FOR 24 VAC ACROSS THE GAS VALVE AND GAS VALVE TERMINALS ON IFC. NOTE: SOME MULTIMETERS WILL FLUCTUATE GREATLY IF VOLTAGE CHECKS ARE MADE WHILE THE SYSTEM IS SPARKING.

CHECK IGNITER POSITION
- MAKE SURE DIRECT SPARK ELECTRODE IS NOT SPARKING TO THE BURNER ASSEMBLY.
- MAKE SURE HOT SURFACE IGNITER IS POSITIONED CLOSE ENOUGH TO THE PASSING GAS TO IGNITE TO CHECK FOR GAS FLOW TO AND FROM GAS VALVE IS ALL OF THE ABOVE CONDITIONS MET?
  - YES
  - NO
    - REPLACE IGNITER

MAKE SURE GAS IS GETTING TO THE BURNERS AND IGNITERS ARE POSITIONED PROPERLY FOR IGNITION
  - YES
  - NO
    - ADJUST IGNITER POSITION & REPLACE GAS VALVE IF NO FLOW THROUGH VALVE

CHECK FOR PROPER POLARITY BETWEEN LINE VOLTAGE AND THE FURNACE, CHECK CONTINUITY OF GROUND WIRE, CHECK FLAME SENSE CURRENT, USING YELLOW LED, STAND ON GROUND, IF LED KEEPS FLASHING WHEN THE CURRENT IS MARGINAL OR WEAK, TURN POWER OFF TO UNIT, CLEAN FLAME SENSE SENSOR WITH STEEL WOOL, RESTORE POWER TO UNIT, MAKE SURE THE HOUSE OR COMPLEX IS GROUNDED PROPERLY—GOOD EARTH GROUNDED.

CHECK CONTINUITY OF GROUND WIRE AND THAT THE HOUSE OR COMPLEX IS PROPERLY GROUNDED. IF GROUND IS POOR OR ERRATIC, SHUTDOWN CAN OCCUR OCCASIONALLY EVEN THOUGH OPERATION IS NORMAL. WHEN THE UNIT IS BEING CHECKED, CHECK FLAME SENSE CURRENT AND OBSERVE FLAME SENSE LED, USE THE SAME PREVIOUS PROCEDURES TO CLEAN REMOTE FLAME SENSE PROBE.

WEIGHT 30 SEC AND RESET SYSTEM

CHECK FOR 120 VAC ACROSS BLOWER TERMINALS, HEAT AND NEUTRAL ON IFC.
  - YES
  - NO
    - REPLACE BLOWER MOTOR
    - REPLACE IFC

CHECK ALL THERMOSTAT CONNECTIONS FROM THERMOSTAT TO IFC OR OBSERVE 24 VAC ON "W" TERMINAL ON IFC. IF THERMOSTAT OPERATION IS NORMAL AND THE CONNECTIONS ARE GOOD, REMOVE GAS VALVE LEADS.

INDOOR BLOWER MOTOR TO STOP AFTER 5 SECONDS
  - YES
  - NO

NOTE: CHECKS FOR PROPER MAIN BLOWER OPERATION IN COOLING AND FAN MODES SHOULD BE MADE USING THE PROCEDURES ABOVE FOR TROUBLESHOOTING BLOWER, THE THERMOSTAT SIGNALS AND IFC SHOULD BE INCLUDED IN SUCH BLOWER ANALYSIS.

REPEAT PROCEDURE UNTIL TROUBLEFREE OPERATION IS OBTAINED.
